Shared, timely information is critical to good health care, especially when that care happens at home rather than in a hospital. Home health practitioners need access to information that is not only reliable, accurate and quickly accessed, but also mobile. VHA Home HealthCare (VHA) is creating an Electronic Health Record for personal support, nursing, and rehabilitation clients to achieve this. GBC researchers helped develop application requirements for VHA staff and service providers in the field. Working closely with VHA, student teams focused on building a solution that works for everyone: client, caregiver and provider.
