Medications are an important part in any patient’s recovery. This becomes especially true for people with mental illness, for whom a missed pill can mean severe recovery setbacks and even hospital visits. But with complicated medication regimens, it’s sometimes hard to remember to take them. The Centre for Addiction & Mental Health came to George Brown with a vision. Together with George Brown students from the Mechanical Engineering program, they developed an automatic pill dispenser with built-in voice reminders and a programmable schedule, making the road to recovery a little bit easier.
