Canadians are living longer: by 2056, the population of Canadians 65 years and older will double to 1 in 4; those 80 years and over will triple to about 1 in 10. Toronto SME Good Robot knew there was a way that recent advances in technology could help this aging population. Developed jointly with George Brown’s School of Nursing, and Information Technology program, Good Robot’s technology incorporates sensors to track daily activities and then communicates this remotely with family and caregivers. It’s an advancement in home care that lets seniors stay connected to their family and caregivers while still being independent. Loved ones get peace of mind and Canadians can age gracefully. Sounds like a great robot.
